

AngularJS Notes

What is AngularJS?

AngularJS is a JavaScript framework developed by Google to build dynamic single-page applications (SPA).

Features:

- Two-way Data Binding
- MVC Architecture
- Dependency Injection
- Directives
- Routing

MVC Architecture:

Model – Data

View – UI (HTML)

Controller – Business Logic

Modules:

Used to define AngularJS applications.

Controllers:

Control application logic and data.

\$scope:

Acts as a bridge between controller and view.

Directives:

ng-app, ng-model, ng-repeat, ng-if, ng-show, ng-click

Filters:

uppercase, lowercase, currency, date, orderBy

Services:

Reusable business logic (\$http, \$timeout).

Routing:

Used for navigation in SPA using ngRoute.

Advantages:

- Fast development
- Less code
- Easy testing

Disadvantages:

- Performance issues
- Deprecated framework

Interview Line:

AngularJS is a JavaScript framework used to create dynamic single-page applications using MVC architecture.
